Heavy Duty Calculator is a handy and comprehensive application designed to perform both simple and complex mathematical calculations. Clear-cut layout In order to work, you will need to have .NET Framework installed on your computer. The program presents an organized interface with focused options on providing efficient calculations. It offers support for fractions, big numbers and scientific operations, displaying the results with good speed and precision. Division, fractions and other functions Heavy Duty Calculator incorporates five types of divisions, such as decimal, repetitive parts, fraction and remainder, as well as mixed mode. Fractions can be manipulated with the help of four buttons placed beside the name, such as displaying and converting the result as a fraction, as well as transforming the full number into a fraction with denominator. Repetitive parts represent the duplication pattern of a number, dividing it until the same repetitive digit is found and displayed. This function converts the last calculated result to a decimal, regardless of the number of decimals. Furthermore, you can calculate factorial numbers, decimals, as well as sine and cosine, and constants like pi and the "e" value. Configure extra options In some situations, you just need to perform basic calculations in a small window that stays on top of other processes, without any other buttons. This can be done from the "Options" panel, where you can set separate options for the normal and small viewing mode. The application can switch automatically from one view to the other, depending on the current screen size. Furthermore, you can save your work in TXT format or export it to Excel (XLS format). In our tests, the program crashed when RAM usage was exceeded. Evidently, this depends on the complexity of the math operations. #### What's New in the Heavy Duty Calculator?

Heavy Duty Calculator is a handy and comprehensive application designed to perform both simple and complex mathematical calculations. Posted on 13 Apr 2012 02:42 PM C Some of these trial versions are in C# and/or VB, while others are in C++ or Java. And the pricing is anything from free (for a trial version) to \$400.00 (for a perpetual license). It's not clear which app they are targeting. Are they looking at the kids in class or those without a computer? This is a pain for me too. I think they should explain on their page which version they are interested in and which platforms it will run on. I want C#. I'm not in 8th grade and I don't have a car but I do have the means to buy a computer. I recommend just sticking with C#. C is a backwater. Compilers designed to target C are really just OpenGL/OpenAL, and really only good for learning or teaching purposes. Honestly, it's a lot easier to create C# C# than it is C. There's a reason that most serious C# developers are using .NET, C# 2.0 is easier to work with than C++. I've used both, and I prefer C#. Here's the MSDN link to the C# version (I am not sure about the Java/C++/VB versions): I recommend you stick with C# for your programming needs, then you can have your choice of code-compliant compilers: 7. Today is special. The 1st time I do WindowsForms. Sorry, not for the software, but I like to play new applications. lol - Kajickat The most important thing is to realize that the program is a template. If you start out with it, you'll learn a lot about templates in general. That way you're not making the same mistakes I did when I started out.
