Microsoft.NET Framework 4.0 and later provides reflection capabilities to developers, which would greatly simplify the job of writing documentation. By adding reflection capabilities to Sandcastle, not only can Sandcastle produce sophisticated documentation, but in addition, it can also produce full-featured code documentation. Before that, Sandcastle only offered the capability to add XML comments to code. Another improvement is that there is no user interface in Sandcastle. All the logic and database is handled by the intermediate component MrefBuilder.MrefBuilder reports to the build assembly. Sandcastle is not a standalone product. It is part of the.NET Framework SDK. A: In my experience, Reflector does most of what MRefBuilder does as well, with some caveats: Reflector only shows types, not methods and properties Reflector has no support for generics, so it can't produce generic assemblies Reflector has no support for the.NET Framework 2.0, so it can't produce DotNet 1.0 assemblies. The support for editing the XML documentation comments is a bit lacking, but it's more than adequate for most uses. I've had to jump through a few hoops to get Reflector to do what I want, but I don't have the space to go into all of that right now. If you need to specify a base class, for instance, the Create method is a bit of a pain. It's worth noting that Visual Studio will include a refection tool if you're using the Visual Studio 2005 SDK: A: From the Full documentation here: Sandcastle is a rapid documentation generation tool written specifically for Microsoft.NET Framework and Microsoft.NET Framework 2.0. It provides a guided workflow that makes it easy to build C#, C++ and VB.NET source code documentation. Included a lot of pre-requisite set-ups, so it's not easy to get it to work on an install that isn't already doing some of the setup. It does give you the option of building the documentation using the "sandcastle" command, e.g. "C:\Program Files\Sandcastle\csc.exe" /out:"MyUser.cshelp" "MyProject.cs" If you want to add the XML comment templates to

What's New In Microsoft Sandcastle?

Microsoft Sandcastle is a framework for creating MSDN-style community-developed MSDN documentation for.NET and COM libraries. It includes API documentation tools for Visual Studio 2005 and 2008 and Microsoft's Language Integrated Query (MSLINQ). Microsoft Sandcastle is a MSDN-style documentation, meaning: ☐ It is very readable, complete, and easy to navigate. The documentation will help you understand the API easily. ☐ It is very accurate. The documentation will contain both API and Remarks description. ☐ The documentation for each class consists of more than one file. ☐ The documentation does not make any assumption on your familiarity with MSDN. It has 2 components: an XML document refactoring tool and a compilable document generator. The XML document refactoring tool generates a refactored source file that is ready to be compiled and attached to the API documentation. We have made it easy to modify the XML file for your own customizations. The document generator compiles the refactored source file and generates a set of XHTML pages. Currently it is used to generate the documentation for Microsoft's Visual Studio 2005 and Visual Studio 2008 development environment. To compile the document generator for your own customizations, we made it easy to generate documentation from XML refactoring. You can use the Sandcastle tool itself to generate XML sources from refactoring. To build.NET Framework 2.0 on Windows, you need the following software: .Net Framework 2.0 .Net Framework SDK # Visual Studio 2005 # Visual Studio 2008 Please refer to the Sandcastle Tool documentation to build MSDN style documentation for.NET Framework and COM-Interop technologies.
