1. **Open an image in Photoshop CS6**. We'll work on one of the images from Chapter 1. If you're working with a recent image, go to Image → Adjustments → Curves to make any adjustments you want without opening the image. 2. **Choose Image → Adjustments → Curves**. On the Curves panel, you find a graduated gray scale and white point slider. Play with the white point to adjust the lighting in the image. When you're done, you see a preview in the Curves dialog box, as shown in Figure 7-7. To view the previous adjustments, click the up and down triangles at the top left of the white and gray boxes to expand the Curves box. You can also use the History panel's arrow buttons to step back through the previous adjustment levels. UP TO SPEED: The Push/Pull Tool The Push/Pull tool is a kind of eraser that lets you pull out or pull in content within a selection—that is, define the parts of the image that you want to preserve. When you use the Push/Pull tool, content is preserved inside the boundary of the area you're dragging. 3. **Click and drag in the image to make a selection in the image**. When you drag a selection tool over the image, the selection boundary jumps outward from the point at which you started your drag. 4. **With the Selection tool (white arrow), use the Push/Pull tool (shown inFigure 7-8") to select an area of the image**. The Push/Pull tool puts down a boundary around your selection. When you move your cursor out of the boundary, the selected area disappears. 5. **Click to define the selection's edge (light blue line)**. The line automatically adjusts the size of the selection as you drag out a different area of the image. Use the left and right buttons under the navigation bar to enlarge or reduce the area within the boundary as needed. To refine the boundary, use the arrows to zoom in, then click the right-pointing arrow next to the line to reduce the selection boundary, or click the left-pointing arrow to increase the selection boundary. (The dialog box shown in Figure 7-8") explains exactly what's going on.) Once you're satisfied with the boundary, deselect it by clicking inside the boundary with

In the United States, the average person drinks over 90 ounces of beer per year. By contrast, the average person in the United States sniffs and/or smokes cigarettes a few dozen times per year. The transdermal delivery of drugs is the absorption of a drug or drug combination through the epidermis, the outer most layer of skin, rather than through the body's circulatory system as in oral delivery. Although many methods have been developed to deliver drugs across the skin barrier, each has serious drawbacks. The use of penetration enhancers is known in the art to facilitate the penetration of an external composition through the epidermis and into the dermis layer of skin. But, even with use of penetration enhancers, the rate of transdermal delivery is still relatively slow and is not as efficient as desired. Solid lipid particles (SLPs) are dry, free flowing lipophilic particles that can be dispensed to the skin using a device designed to dispense dry solids. A user can place the lipid particles on the skin with a finger or a tongue depressor, and the dry lipid particles then roll down the skin, making a film that can deliver a drug and/or prevent drug from being washed off. A component of these particles is solid at room temperature and may be dispensed on dry skin and then dried to provide the SLP composition. While the incorporation of transdermal delivery or penetration enhancers into SLPs to enhance the transdermal delivery of drugs is known in the art, each of the known formulations still has a drawback.Pages Sunday, August 7, 2013 Friday
