How to Edit Your Photos in Photoshop

Photoshop is most popular for its ability to edit images. It enables you to change the color, enlarge or shrink, or even alter the appearance of an image, all without affecting the image's actual pixels. You can do this by using a separate layer for each piece of an image that you want to edit. By using layers, you're able to overlay edits on the image and thus creating a complex image without having to worry about creating messy effects. You will understand and benefit from the fact that while you are editing with layers you can create a blending option. Blending options are mostly great for taking away unwanted parts of an image and have many advantages when it comes to your finished work. You can also easily undo what you've done to an image as well as roll back to previous edits. This helps if you've made a mistake, thus creating less errors and frustrations throughout your editing process.

Creating Layers in Photoshop

Creating layers in Photoshop is important if you want to edit different parts of an image. Think of layers as separate sheets of plain paper that you can move to or away from each other. By using Photoshop layers you can edit different parts of an image without the worry of ruining the rest of the image. Layers are also a great tool for making sure that you can make edits without having to edit the same image multiple times. Each layer can be changed independently, making the process more efficient. So, let's look at how

Q: How do I determine if all properties in a NSMutableDictionary are nil? I have a class structure like so: @interface Fruit : NSObject { NSString *name; NSString *price; ... } @property (nonatomic, retain) NSString *name; @property (nonatomic, retain) NSString *price; ... In another class, I have a NSMutableDictionary *dictionaryWithFruits as one of my properties. So if I instantiate an object of my Fruit class, and assign one of the properties that are declared in the Fruit class, it works fine. My problem arises when I attempt to assign one of the properties that are declared within an instance of a class other than Fruit. Specifically, in my NSMutableDictionary dictionaryWithFruits, I try to populate it by assigning each property the value of an object in another NSMutableDictionary. It seems that whenever I try to assign the name property, everything within the dictionaryWithFruits is nil. I have no way of knowing why this is happening. How can I determine if all the properties in my NSMutableDictionary are empty? I'm aware of the fact that it's possible to explicitly do an empty assignment, like this: self.name = self.name; How can I do this using KVC, since I don't know what properties are going to be accessed. I tried writing this using the setValue:forKeyPath: method, but it says that dictionaryWithFruits[@"name"] is an 'illegal option for key path', and I'm not sure what that means. A: I hope this is what you were looking for: NSMutableDictionary *dictionaryWithFruits = [NSMutableDictionary dictionaryWithObjectsAndKeys: [NSString stringWithString:@"apple"], @"name", [NSString stringWithString:@"10"], @"price",
