What Photoshop Can Do Once you create an image in Photoshop, you can easily save it in a variety of formats and file sizes, such as tiff, eps, pdf, jpg, and so on. You can also save your image as a layered file, enabling you to easily edit the file in different ways. A Layered File Allows You to Edit the Image Multiple Ways When you create or open a layered file in Photoshop, you can change the colors, enhance the lighting, or customize the image's look as if you were editing the image in a more traditional image-editing program like Adobe Lightroom or your own digital camera. The editing is done at the pixel level, allowing you to make

changes to every pixel in the image or to portions of it. It's a great way to make tweaks to an image that will appear seamlessly when printed. A Few Drawbacks of Photoshop Because it's available on Mac computers as well as PCs, Photoshop is a popular choice for image manipulation among those who own a Mac laptop or desktop, but it can be a bit of a challenge to use some of Photoshop's features on a Mac. For example, you'll have to think twice before you work with layers, meaning that if you have a layer in a document, you'll have to save it as a layered file, rather than creating a copy of the file without a layer. You have to save it as a PDF or TIFF file if you want to use it in another application. You may have to work around some serious speed

issues, too, as your Mac can't handle as many layers as you can have in a Photoshop file. In fact, after creating over 100 layers in Photoshop, you need to shut down your application in order to get it to open the next time. Also, programs that create multiple layers by default, such as PaintShop Pro, have problems opening layered Photoshop files. What Photoshop Can't Do Because Photoshop is based in raster images, it isn't well suited to work with most styles of vector images, such as those found in Adobe Illustrator. It can also be a bit more difficult to manage files on a Windows computer with an extranet than on a Mac. Because Photoshop creates JPEG or TIFF files on Windows, instead of layered files, it's not so easy to make changes to a file. You have to save

the file as a PDF or TIFF file to import it into other programs

Q: How to install react-native-maps without error: "react-native-maps not found" I downloaded the react-native-maps from here. I followed the install instructions, I installed the dependencies and the react-native-cli and checked all the things are OK. Now, when I type react-native-maps in the terminal, it shows react-native-maps not found. I'm new with react-native. A: Ok I found the solution. The problem is that the react-native-maps installed in react-native-code-push. Q: How does AIX handle out of core or deleted files? We recently had a hard drive failure and a large amount of files were deleted on the main drive (600+ GB). After recovery, we'd like

to know if we'll have a performance problem as a result of some files being deleted on disk and not in core. If a file is deleted from the main drive, is it copied to the swap drive and placed in core until the machine is rebooted, and then copied back to the main drive? Or does it just not exist at all? A: Whether a file is in core or not depends on it's type. On AIX an "out of core" file is typically a journal file which isn't stored on the primary disk anymore, but somewhere on the swap drive. The swap drive includes a journal, too, but it isn't as large as the primary disk's journal (usually 1GB by default). Whether a file is "deleted" or "truncated" is up to the operating system. Linux will just create a truncated file on the disk and either not remove the file from RAM or leave

it in the ram as an "inuse" file which contains its last (and possibly only) portion. AIX will create a truncated file on the primary disk and then mark the file as deleted. If you remove a file on AIX you also must first write a "cleanup record" to the swap partition, i.e. the "cleanup" file. Typically there's a performance overhead whenever a file is in core. The "swap" partition is typically on a different disk, so only a small fraction of the files on the other disk are actually swapped. If you have a small swap partition this overhead should be small, but for a large swap partition

Q: Obtain pid of any instance of this

python program I have a python3.6 script that has the following: import websockets import time import signal import os import psutil what I want to do is to get the pid of any instance of this script. So I can use that pid to kill/restart the process if need be. Is it possible to do that. my script will be runnable for a specific amount of time and I want to be able to restart it. Also, I will want to be able to export the list of its instance's pid. This is what I tried so far: import subprocess pids = [] def find_pids(command): try: proc = subprocess.check_output(command) return proc.split(' ') except subprocess.CalledProcessError: return [] while True: with websockets.websocket("wss://stream.website.com/sock") as ws: message = ws.recv()

print(message) pids +=
find_pids('python3
/home/%s/myscript.py')
time.sleep(60) If the content is
changed to import websockets import
time import signal import os import
psutil mypid =
psutil.Process(os.getpid()) mypid
print(mypid.pid) I get: 131 I am not
sure how to parse this, if a pids can
be gotten out of it. If this is not
posible, what other alternatives are
available? A: To accomplish what you
want, I would use the multiprocessing
module. This will allow you to spawn
child processes (called subprocesses)
from your main program, and pass
them information so they can
communicate. Using the main
program as the controller means that
the main program will know who is

running it. You can do this by first reading all of your PIDs into a list (assuming you only have a single script running at a
