1. Field of the Invention This invention relates to an improvement in x-ray mammography apparatus, and more particularly to a method and apparatus for making a x-ray image wherein the objects to be examined are moved in the direction of the x-ray beam.

2. Description of the Prior Art U.S. Pat. No. 3,778,614 to V. T. Devane et al. describes a method and apparatus for making an x-ray image which includes an examination table of a certain thickness that is parallel to the plane of the detector. Further, the apparatus has x-ray generating source means producing a plurality of parallel x-ray beams, each of which is reflected from a respective of a plurality of reflecting means. The means for generating x-ray beams may be movable toward or away from the patient to be examined. It has been found that such an apparatus may not achieve the very high resolution images needed in mammography if the patient is not entirely supported by the examination table. When the table extends from the floor to the ceiling, there may be very little lateral movement of the patient with respect to the x-ray beam. This is particularly true where there is great variation in thickness of the patient's body (e.g., caused by obesity) or where the patient is lying on a bed. The x-ray beam must pass through the examination table for a large portion of its penetration into the patient, resulting in attenuation of the x-ray beam and, therefore, an effect of diminished resolution. The patient may also be constrained in his lateral movement by the x-ray tube which is positioned above the examination table.

ACRAL ORIGIN OF LYMPHOMAS: LIPID ROLE--A TIMELINE PATHOGENESIS STUDY. In a previous study we have shown that in the majority of acquired immunodeficiency syndrome (AIDS)-associated cutaneous lymphomas (CLL) the lymphoma originates in the ACRAL region of the skin (Bazan RS et al., Cancer Epidemiology Biomarkers Prev, 2003; 12:1556-60). In this study, we aimed at understanding the possible causes and time-line development of the disease. The study includes 50 patients with CLL histologically proven by skin biopsies.

Q: How to get the input type of the field in textbox? I have an editable textbox and I want to get the input type of that textbox. How can I achieve this? A: You can get the value by using attribute value. `var inputType = $(this).attr('type');` //inputType will be 'text'

Sage Records Sage Records, Inc. was an American record label founded in 1999, by John Mangos in his garage. The first album released on the label was the self-titled one by Sage. Before they started recording the album, John and Sophia (both of whom were in school at the time) traveled to Bill and Kathy's house, where Sage was recorded in their barn. Sage Records is often considered a "success story" in the independent music industry. The label is based on the principle of "No one owns us, we own us." History John Mangos began recording at age 17 and began playing live in high school clubs and bars in the San Francisco area, where the majority of his influences were from. He moved to New York City, and started playing music at the various clubs around that area. While studying at George Washington University he formed the band. In February 1999, Mangos was living in Brooklyn and recorded what would become the first album ever released on Sage Records. This album was called Sage. The original pressing of the album sold out in one day, in just enough time for it to sell to Rough Trade Records, a division of Beggars Group. The label then changed its name to Rough Trade Records, Inc. In April 1999, the band started work on their second album, 'Suffer the Children' which was released in December. The album was recorded in John's apartment (which was located in the East Village), and due to the increasing popularity of Sage, they were able to secure a larger studio. The Suffer the Children album was named Album of the Week by Melody Maker, and led to support from

Q: Problem creating and solving a system of equations that use a summation symbol The following system of equations contains multiple summation and summation signs in it:
$$\begin{cases} x+2y+z=11, \\ 3x+4y+z=9, \\ y+z=5. \end{cases}$$
 As far as I can tell, the answers are $x=4, y=1$ and $z=4$ and $x=6, y=1$ and $z=2$. Which method should I use to solve the system of equations? A: Hint: you can expand the equations $x+2y+z=11$ $3x+4y+z=9$ $y+z=5$ and insert the sum over z at the end.

Mutations in the ionotropic glutamate receptor subunit NR2C modulate the biochemical properties of the subunit. The NR2C subunit of the N-methyl-D-aspartate receptor (NMDAR) is targeted to the plasma membrane via a glycoposphatidylinositol linkage to allow extracellular ligand binding and activation of NMDARs. Here, we characterized the effects of mutations in the NMDAR2C subunit on the molecular and functional properties of the receptor. We show that residues in the putative glycoposphatidylinositol linkage (S(366) and G(370) of the third intracellular loop) and the N terminus (D(43) and A(46)) modulate the molecular properties of the subunit. Furthermore, the glycine binding affinity of mutant receptors was affected. Finally, the physiological properties of the mutant receptor differed. Mutation of the N(365)S(366) to A (N365S/A366) increased the potency of glycine and glutamate, and NMDAR currents and glutamate-evoked calcium influx were greater compared to control receptors. In contrast, mutation of G(370) to A (G370A) resulted in the opposite effects. These mutations resulted in a shift in the glycine EC(50) to lower concentrations, i.e., increasing glycine affinity, and an increase in glutamate sensitivity. We conclude that the majority of the functions of the NMDAR
