But to truly re-imagine any image, Photoshop (known as Photoshop CS or Photoshop 7, depending on the version) has far more powerful editing features, such as the capability to create layers of image elements with different transparency settings, add and subtract one image over another, apply filters on multiple layers, transform images with the various tools, and create raster art. Photoshop has enough editing tools, workflows, and features to truly wow even the most sophisticated user. However, you don't need to be an expert to create some spectacular effects with Photoshop. Q: Does using a file to decompress all the other files in a given directory increase the speed of decompression? I need to decompress a lot of files using the DECOMPRESS (manual) command in the cpl command line tool, for about 10000 files. Is there a way to do that faster by using the -j option of the cpl program, or do I need to use another program to do this? A: Provided you have enough file systems (RAID, NFS, etc.) on the computer to decompress the 10000 files you mentioned, no. Otherwise you'll run into I/O bottlenecks. *bestIndex = -1; } } printf(" %2d\t%2d\t%.3f\t%.3f\t%5.2f%% ", i, j, bdex1[i], bdex2[j], calculatedNorm[i*cols+j] / norm); } printf("%5s\t%5s ", "time(s)", "time/iter"); for (i = 0; i

Q: Linq to Entities. Any fast way to get a certain relation count? I am trying to update some values in a database column, but depending on which options are selected on a screen before I hit save, I want to know the row count before I make the update. To do that, I was thinking to write a simple LINQ to Entities query to query the database for the values of a certain column and to count it. If that would be faster than checking the database before hand, that would be good. I just don't want to miss something in this approach. A: you can use the DbContext.ChangeTracker property to see which entities have been modified since the last time you loaded the entities. DbContext.ExecuteSqlCommand and DbContext.ExecuteStoreQuery are your friends here... 1. Field of the Invention The present invention relates to a protective valve and, more particularly, to a protective seal intended to be used with steam lines. 2. Background Art The protective valve of this invention is of the type used in steam lines to protect the steam distribution system from debris which is introduced into the system and would detrimentally affect the operation of the valves and other system components. Such debris could be generated by erosion, cracking of system components, or a ruptured pipe. Such debris is normally contained within the system during operation. However, water leakage, temperature fluctuations, etc. can cause the debris to travel to other areas of the system and end up at other components within the system. Such debris can cause significant structural damage as well as corrosion to the steam system components. Various methods have been employed to avoid this problem. For example, the prior art has employed valves which are designed to protect system components from corrosion and the like. It would be advantageous to have a protective valve which is designed to reduce the possibility of certain types of debris entering the steam system and which, in the event that such debris does enter the steam system, will protect the system components against damage which may result from such debris. An object of the present invention is to provide a protective valve. Another object of the present invention is to provide a protective valve that prevents or minimizes the entry of debris into a steam system. A further object of the present invention is to provide a valve assembly that reduces the likelihood of system component damage by debris entering the steam system. A still further object
