For Android, click here. It was released in 2008 by the Israeli company Fing Wireless and was the world's first. You can download for \$4.99 from the Android. On PC I tried and was met with a prompt to install the Java download from Sun. The present invention relates to a security problem in communication networks and, more particularly, to a method and system for providing an adaptive security system for a high speed communication network. A High Speed Circuit Switching (HSCS) system is a type of communication system referred to as packet switched. The basic functions of a packet switched communication system are shared with other switched communication systems such as traditional circuit switched telephone and data networks. A packet switched communication system adds to the basic functions the ability to transmit data through the use of packets. Each packet contains an embedded header field which includes relevant information including sender address, receiver address, the length of the packet, and the protocol used to form the packet. For systems supporting only a small number of protocols, the header information is used as the sole means to route the packet to its destination. A header field is used to identify a system. For example, T1CIS (Translating Circuit Identification Scheme) provides a 15-bit field which is divided into four 7-bit fields which identify the specific test instrument and system. If the 15-bit field is 11,100 it indicates that the signal is being passed through a T1CIS system. Using the T1CIS information, the protocol used to form the packet can

---

be determined and the individual packets can be routed accordingly. A commonly used packet switched communication protocol is Asynchronous Transfer Mode (ATM). ATM is a protocol for connecting two points with a high speed connection. ATM recognizes that the number of simultaneous users on a circuit is not fixed, and all users have access to the same transmission medium. The basic network model of ATM is a plurality of users connected to a Communications Switched and Transfer Mode (CS-TM) network. ATM transmits information in the form of packets which are switched by a switch through a network. The packets may be of variable length. There is an advantage in using variable length packets in the sense that a variable length packet may be transmitted over a network without the need for expanding the network to accommodate longer packets. For example, because data is transmitted in packets of variable length, it is not necessary to expand the network to accommodate packets containing more data. Thus, user's and network expenses are reduced.
